

Dry Gas Seal Panels | for Turbo Compressor

The dry gas seal panel is a critical part of a dry gas seal system. Once a seal configuration has been selected, a panel must be designed to support the dry gas seal cartridge. The panel design must deliver sufficient and proper seal supply gas to the dry gas seal. The panel consists of filters, pressure/flow control valves and various devices to condition, control, and monitor the gas into and out of the dry gas seals. Panel is designed to supply seal buffer gas to the shaft seals of various rotating compressors, providing containment of these process gases.
